## Table of Contents

Tables .....	9
Figures .....	9
<b>Introduction .....</b>	<b>1</b>
<b>Chapter 1: Recreational diving today: decompression habits, DAN Europe database insights .....</b>	<b>13</b>
Take-home messages .....	13
Abstract .....	13
1. Development of recreational dive limits .....	14
2. Dive computer validation .....	16
3. Insights from DAN Europe database .....	21
Conclusions.....	34
Related sources .....	36
<b>Food for thought: Can we “BAYES” our approach to decompression? .....</b>	<b>37</b>
<b>Chapter 2: Recreational technical diving .....</b>	<b>41</b>
Take-home messages .....	41
Abstract .....	41
1. Status quo.....	42
2. “Turning Tek” .....	44
3. Know the limits.....	50
4. The frontier physiology limits.....	52
5. Where to next? – The Future .....	55
Related sources .....	57
<b>Chapter 3: Commercial diving .....</b>	<b>58</b>
Take-home messages .....	58
Abstract .....	58
1. Surface supplied diving.....	59
2. Saturation diving .....	66
Conclusions.....	86
Related sources .....	86

<b>Chapter 4: Decompression theory</b> .....	<b>88</b>
Take-home messages .....	88
Abstract .....	88
1. Diver perspective: “The Unearned Hit”, by J. Chatterton .....	89
2. Overview of decompression algorithms.....	93
3. In vivo bubble formation and growth unknowns .....	103
4. The future of decompression theory.....	108
5. Flying after diving .....	111
Conclusions.....	113
Related sources .....	113
<b>Food for thought: The oxygen window in decompression</b> .....	<b>115</b>
<b>Chapter 5: Diving and the blood vessels</b> .....	<b>118</b>
Take-home messages .....	118
Abstract .....	118
1. Endothelial function .....	119
2. Endothelium & decompression .....	121
3. Non-pathogenic decompression and endothelium.....	122
4. The microcirculation .....	123
5. Vascular smooth muscle vs. endothelium .....	125
6. Relationship with the quantity of bubbles .....	126
7. Duration and chronic effects .....	127
8. Mechanisms of the post-dive vascular impairment .....	129
9. Inflammation .....	131
10. Endothelial function as a risk factor for VGE and DCS .....	133
Conclusions.....	134
Related sources .....	135
<b>Food for thought: Just say NO to decompression stress</b> .....	<b>137</b>
<b>Chapter 6: Bubble measurement techniques</b> .....	<b>141</b>
Take-home messages .....	141
Abstract .....	141
1. Ultrasonographic techniques used to screen for circulatory bubbles .....	142
2. Comparative studies .....	152

3. Application of circulating bubble screening - recommendations, interest, limitations.....	153
Conclusions.....	155
Related sources .....	155
<b>Food for thought: Hydrophobicity, the link between bubbles, bubblebers &amp; autoimmunity</b> .....	<b>157</b>
<b>Chapter 7: Preconditioning as a tool to improve diving safety</b> .....	<b>160</b>
Take-home messages .....	160
Abstract .....	160
1. Pre-dive endurance exercise .....	161
2. Pre-dive hydration .....	164
3. Pre-dive oxygen breathing .....	167
4. Pre-dive heat exposure .....	171
5. Pre-dive vibration .....	173
6. Biochemical preconditioning.....	176
Conclusions.....	179
Related sources .....	180
<b>Food for thought: Is your state... steady?</b> .....	<b>181</b>
<b>Chapter 8: Bubble arterialisation: PFO and pulmonary shunts</b> .....	<b>183</b>
Take-home messages .....	183
Abstract .....	183
1. The flow of blood through the human body .....	184
2. Nitrogen bubbles after decompression.....	185
3. Patent foramen ovale (PFO) explained .....	188
4. Bubbles embolising the brain .....	191
5. Breaking the pulmonary bubble trap .....	192
6. Arterialisation and decompression sickness risk.....	194
Related sources .....	197
<b>Chapter 9: Nitrogen narcosis</b> .....	<b>198</b>
Take-home messages .....	198
Abstract .....	198
1. The physics behind IGN .....	199

2. Understanding nitrogen narcosis .....	201
3. Measuring nitrogen narcosis .....	205
4. Preventing nitrogen narcosis .....	211
5. Adaptation to nitrogen narcosis .....	213
Conclusions .....	214
Related sources .....	215
<b>Chapter 10: DCS Evaluation – Cluster Analysis of DCS .....</b>	<b>216</b>
Take-home messages .....	216
Abstract .....	216
1. Data mining .....	217
2. Classification .....	218
3. Cluster analysis .....	220
4. DCS classification .....	224
Conclusions .....	226
Related sources .....	227
<b>Chapter 11: Decompression Sickness – Controversies and Remote Management .....</b>	<b>228</b>
Take-home messages .....	228
Abstract .....	228
1. Introduction to DCS occurrence .....	229
2. "Ideal" vs. "improvised" DCS management .....	236
3. DCS outcome .....	252
Related sources .....	255
<b>Food for thought: Creativity in science.....</b>	<b>257</b>
<b>Authors and authors' affiliations.....</b>	<b>260</b>

## Tables

Table 1: No-decompression time in minutes for a given depth and given computer set to the standard settings (air, sea level, fresh water).....	16
Table 2: Common levels of technical diving .....	45
Table 3: Major differences between recreational and commercial diving .....	60
Table 4: Pneumogauge corrections (originally published by United States Dept. of Navy in 1985). .....	64
Table 5: Decompression schedules for 30 minutes at 54 meters on air and heliox using different procedures.....	65
Table 6: Early Comex heliox saturation decompression procedures .....	72
Table 7: The average daily ascent rate during final decompression from saturation. ....	75
Table 8: Bubble grading with the Spencer scale (first established in 1974).....	144
Table 9: Kisman-Masurel code (originally published in 1983) .....	144
Table 10: Brubakk & Eftedal scale (2007) .....	147
Table 11: 2D Echocardiographic and PW Doppler Grade (Boussuges 1998).....	150
Table 12: Physical properties and narcotic potency of different gases .....	200
Table 13: Clinical signs observed in man during nitrogen narcosis.....	202
Table 14: Seven cases with two data variables.....	221
Table 15: Squared Euclidian distances between observations in Table 14.....	222
Table 16: Divers Alert Network DCI clustering results .....	225

## Figures

Figure 1: Types of dive computer used in the 39944 dives recorded in the DAN Europe DSL Database. ....	22
Figure 2: Gradient Factors for the 12.5 minutes compartment with respect to M-Values, as reached by DSL divers during 14000 analysed dives (graph courtesy of Corrado Bonuccelli).....	23
Figure 3: Exposure Factor (EF) distribution over 14000 analysed dives (graph courtesy of Corrado Bonuccelli) .....	24
Figure 4: Depth/time distribution of 39944 dives recorded in the DSL database. ....	26

Figure 5: Declared health problems in divers from the DAN Europe DSL database .....	27
Figure 6: Type of algorithm (bubble or compartmental) used in dive computers over 10738 recorded dives and 165 DCS cases related to the use of diving computers. ....	28
Figure 7: Box-plot of calculated tissue supersaturation levels on 165 cases of DCS recorded over 10738 DSL dives. ....	29
Figure 8: Distribution of VGE Doppler recordings in the DAN DSL database. ....	30
Figure 9: Median bubble score post-dive with respect to hydration level .....	31
Figure 10: Physiological variations after a dive (n=90). ....	32
Figure 11: Surface tension of some body fluids at body temperature .....	34
Figure 12: Technical divers with underwater scooters and semi-closed re-breathers (Photo courtesy of Miroslav Potas). ....	46
Figure 13: Cavern; a starting point for cave diving, usually defined as a zone of a cave with direct visual contact and access to water surface illuminated with natural daylight. ....	47
Figure 14: Probability of death in case of equipment failure in series or parallel (adapted from Piantadosi, 2003; see related sources). ....	52
Figure 15: The supervisor carrying out a checklist on the diver. ....	61
Figure 16: Portable gas control panel .....	62
Figure 17: The umbilical consists at least of 3 hoses; the yellow hose (brightest in the picture) is the pneumogauge hose. ....	63
Figure 18: Pneumogauge schematic (source: US Navy Diving Manual rev 6). ....	63
Figure 19: The control panel of an offshore commercial operation. ....	66
Figure 20: Typical saturation dive profile. ....	69
Figure 21: A typical saturation chamber system located below deck in a North Sea diving support vessel. ....	72
Figure 22: The classic perfusion gas exchange model. ....	76
Figure 23: The critical volume assumption scenario applied to saturation. ....	78
Figure 24: Relationship between ascent rates and risk of DCI, for a given chamber ppO <sub>2</sub> . ....	81
Figure 25: The various saturation decompression rates from the main diving contractors plotted according to depth. ....	82
Figure 26: Richard Pyle puncturing the bladder of a fish while ascending from the depth. ....	96

Figure 27: Super-saturation of fast and slow compartments for a shallow and deep stop profile. ....	97
Figure 28: "Dive phone" iPhone App showing two different no decompression times (29 min. vs. 11min) (Divephone photo courtesy of Innovasub) .....	100
Figure 29: A horizontal diver during deco (photo courtesy of Peter Vaverka).....	103
Figure 30: Without a stabilisation mechanism to counteract the microbubble's surface tension, bubbles below a critical radius will tend to dissolve at atmospheric pressure.....	106
Figure 31: Four chamber view echocardiography of a diver at flight cruise altitude .....	112
Figure 32: The effect of breathing 100% oxygen on the oxygen window. ....	116
Figure 33: Structure of the human artery and interactions between endothelial cells and smooth muscle cells. ....	120
Figure 34: FMD assessment by the measurement of brachial artery diameter with high-resolution ultrasound. ....	123
Figure 35: Post-occlusive Reactive Hyperaemia (PORH) measurement technique. ....	124
Figure 36: Effect of SCUBA diving on circulating NO and FMD. ....	130
Figure 37: Apical four-chamber view: circulating bubbles in the right cavities of the heart. ...	145
Figure 38: Apical four-chamber view: circulating bubbles in the right cardiac cavities with passage in the left cavities. ....	146
Figure 39: Frame-based bubble counting .....	148
Figure 40: Parasternal short axis view: study of pulmonary blood flow by Pulsed-Wave Doppler. ....	149
Figure 41: Normal pulmonary blood flow as shown by PW Doppler. ....	150
Figure 42: Circulating bubbles detected in the pulmonary blood flow: the arrows indicate bubble signals in each cycle overriding the pulmonary blood flow .....	151
Figure 43: Possible positioning of the transducer for TTE: apical view (A) and parasternal view (B); transoesophageal echocardiography (C) .....	152
Figure 44: Proposed mechanisms underlying the protective effect of exercise on vascular gas bubble formation.....	164
Figure 45: Beneficial effect of large-volume oral hydration on vascular gas production monitored by Doppler after a dive. ....	166
Figure 46: Speed of absorption of marked proteins (angular variation) in the axillary region after subcutaneous injection. ....	170

Figure 47: Dynamic changes in HSP concentration after a single sauna exposure. ....	172
Figure 48: Effect of a pre-dive sauna exposure on post-dive endothelial dysfunction (measured by FMD) and bubble count. ....	173
Figure 49: Effect of pre-dive whole body vibration on post-dive endothelial dysfunction (measured by FMD) and bubble count. ....	174
Figure 50: Accelerated peripheral elimination of radioactive tracer after vibration in axillary lymph nodes. ....	175
Figure 51: Effect of dark chocolate on post-dive endothelial dysfunction and bubble count.	177
Figure 52: A proposed molecular mechanism of chocolate contribution on reducing endothelial dysfunction associated with breath-hold and SCUBA diving. ....	178
Figure 53: Effectiveness of different means of preconditioning on endothelial function preservation as measured by FMD and post-dive VGE production. ....	179
Figure 54: Schematic overview of the circulatory system.....	184
Figure 55: Circulatory system before birth.....	189
Figure 56: Circulatory system after birth. ....	190
Figure 57: Correlation and linear regression of the magnitude of CFFF change and time to complete in both Math Processing task and Trail-Making Task under normobaric oxygen (A), Hyperbaric Air (B) and Hyperbaric EANx (C). ....	207
Figure 58: Waterproof CFFF device specially developed for research purposes (Human Breathing Technology, Italy) .....	208
Figure 59: The Math Processing Task, one of the tests from the Psychology Experiment Building Language battery (PEBL) in a diving computer (Courtesy of Mares S.p.A.). ....	208
Figure 60: Percentage variation of CFFF during and after a 25 min air dive to 30 meters/110 feet. ....	209
Figure 61: NIRS measurements of HbO <sub>2</sub> and HHb during and after a 25 min air or EANx dry chamber dive to 30 meters. ....	211
Figure 62: CFFF and computer-based behavioral testing measurements during and after a 25 min air or EANx dive to 30 meters/110 feet. ....	213
Figure 63: Clustering steps .....	223
